INLET REPAIR

PUT YOUR TRUST IN OUR EXPERTS

At GlobalParts Aero Structures we bring together experience and quality with an extensive range of inlet capabilities that enable us to repair and replace D-rings, Frames and Barrel or Outer skins so that they look and perform as good as new. From cracks and corrosion – to chaffing, metal fatigue or F.O.D, our experts utilize specialized FAA-Approved repair and replacement processes to resolve virtually any inlet issue with industry-leading results.

Gulf Airline Growth Not Matched by Recruiting Policies

BY ANDREW DRWIEGA
EDITOR-IN-CHIEF

Attending the MRO Middle East conference and exhibition in Dubai was, to a certain extent, going back to a previous life for me. Back in the 1990s I spent several years working in the rapidly growing Emirate working for the Dubai World Trade Centre, an independent British bank, and then for my own public relations company.

Emirates Airlines was then the 'upstart on the international airline block'; rising out of the sand to challenge the established national carriers, predominantly from Europe and southeast Asia, to become the first of the Gulf hubs. British Airways had to ensure its flights from London had the latest inflight entertainment system in order to keep passengers from deserting to experience the wonderful seat-back screened content on every Emirates flight to Europe.

Wind forward just a couple of decades, and the Gulf/Middle Eastern market is now full of national carriers and burgeoning low cost players, most of which are founded on national oil and gas wealth. Emirates Airline is now in the top five airlines in terms of international passengers carried each year.

But the oil price slumped and has not yet roared back to the heady days of US\$90-\$100+ per barrel during 2010-14. As Air Arabia's group CEO Adel Abdullah Ali said during his opening address at the MRO Middle East conference: "The oil price is like blood pressure; it should neither be too high or too low." He said the right price was between US\$70-80 per barrel, whereas the price for the last two years has averaged less than US\$50 per barrel, and dipping at its lowest point to around US\$30 per barrel.

That gap in income has hurt the Gulf's oil producers although there is still almost an air of denial which permeates the region. Spending on infrastructure and airport expansion continues at pace, with Dubai looking to move Emirates Airline and many other services into Dubai South, and away from its city centre location which has grown out of all proportion over the last 20 years.

In the State of Qatar, the third phase of the project to expand Hamad International Airport (HIA) in Doha is due to begin this year. According to Akbar Al Baker, group chief executive of Qatar

Airways, the new expansion will "take the ultimate capacity to over 65 million passengers (annually)." However, Qatar has huge natural gas reserves to fall back on...and price cutting to win passengers has not gone down well with the other Gulf carriers.

Ali also pointed out that airline behaviour has not matched economic reality. "There have been too many aircraft orders....which have exceeded growth expectations. Regional carriers also want to get into the GCC (Gulf Cooperation Council) market." As the regional competition 'hots up' and while it remains a great time for the buyer, Ali wondered whether it was sustainable.

What this has done is create a demand for a much larger workforce in the aviation industry at all levels within the region. However, as Ali said, the cost of manpower within the Gulf continues to rise at a significant rate. "Today it is cheaper to recruit a pilot from the UK or Australia than from the Gulf," he observed

The expansion has naturally led to the need for more maintainers too, who need to be suitably qualified. But therein lies a problem. Many of the airlines within the Gulf are selective about which international qualifications they will accept. In some cases, well qualified and experienced individuals are not considered because they do not have a qualification which is recognised by a particular organisation or at a national level. There also seems to be no quick solution to 'fast track' such people, other than by making them start at the beginning to requalify – a process that can take years. The result is that rising demand for experienced maintainers is very quickly outstripping supply. **AM**

OEMs Turn to MRO as Rotorcraft Sales Stall

The main reveal at Heli-Expo was Bell Helicopter's FCX001 Future Concept helicopter. Features would include morphing main rotor blade tips, multiple fans in the tail-boom for anti-torque, and augmented reality cockpit. (Photo: ATP)

Andrew Drwiega reports from this year's Heli-Expo in Dallas where the downturn in the energy sector resulted in a subdued atmosphere. Business minds are turning to MRO to claw back revenues.

The very obvious downturn in new orders being experienced by the helicopter industry globally has seen an increased focus on customer support and service by the main helicopter manufacturers, a fact witnessed at this year's annual gathering of the helicopter industry, Heli-Expo (7-9 March) staged in Dallas, Texas.

Sikorsky president Dan Schultz, speaking on the morning of the first day remarked that his company was now completely 'severed' from previous owner, UTC. Customer support, he said, was one area on which the company under Lockheed Martin was keen to improve.

"One year ago I was disappointed in customer support," he admitted. "Many customers were upset with us in 2016. We have since hired dozens of customer representatives and we have been supporting aircraft-on-ground (AOG) on a 24/7 basis. These are airplanes that have to be ready and reliable." AOG is a maintenance term denoting a problem serious enough to prevent the aircraft from flying.

Dana Fiatarone, vice president for commercial systems and services, said that new customer support initiatives and the extra service representatives had allowed Sikorsky "to make tremendous strides in 2016."

"Aftermarket was one of the things we needed to focus on. Now we have long term assurance programmes - some as long as a decade."

He said that aircraft availability was now better than 95 percent for both the S-92 and S-76 fleets. There had been a 20 percent increase in flight hours last year. "Customers said we need to increase flight hours - can you support us."

The opening of four stocking centres in Scotland, Norway, Australia and Brazil now meant that part ordering was now taking less than a day to be turned around "and in some cases less than an hour." The Norwegian centre made over 200 parts shipments in Q4 2016. Fiatarone also said that Sikorsky was analysing stocking levels compared with the demand for parts, which varied between the regions.

During the show Sikorsky, PHI and Outerlink Global Solutions (a Metro Aviation company) jointly announced that an S-92 helicopter had transmitted in-flight, real-time Health and Usage Monitoring Systems (HUMS) data to PHI's operations control center. This advance will allow S-92 operators to continually monitor the health of each S-92 helicopter in their fleet. According to Lance Bospflug, chief operating officer, PHI: "This new solution enhances flight crew decision making and improves support from the operations control center by providing both with real-time aircraft health information."

MD Helicopters Ramps-Up Online

Lynn Tilton, the owner MD Helicopters, speaking from her stand on the second morning of the show, is now presenting a more promising picture for MD Helicopters' customers as the company can afford to ramp-up service and support thanks to the dollars it is making through military sales, the latest of which is the new MD530G to launch customer Malaysia.

Said Tilton: "It takes a long time to shake stigma. I have to give kudos to our aftermarket team; they have taken a vision that I had and made it into reality. I don't think we have had more than two AOGs this year."

Tilton added that the doubling of field service representatives had also been a major contributing factor to a better service offering for MD's customers.

Having been largely scathing of the supply chain since she took over the company in July 2005, Tilton is keen for MD Helicopter

The Safran helicopter engines plant at Grand Prairie, Texas. Last year the facility turned around 465 engines through its MRO shop. (Photo: Andrew Drwiega)

operators to strengthen their direct relationship, particularly in parts. "We want them to buy our parts and not buy PMA parts."

With MD Helicopters striving to improve its reputation, especially in the MRO field, it is focusing on boosting customer online accessibility with 3D imaging and new deals with companies such as Aircraft Technical Publishers (ATP) to allow better access to maintenance information.

Building on the launch of the MyMD.aero support portal at Heli-Expo a year ago, a deal has now been agreed with Aircraft Technical Publishers (ATP) for MD customers to have access to ATP's Aviation Hub content through the on online Single Sign On (SSO) feature, embedded it the MyMD.aero site.

The online portal will assist MD Helicopters' customers to manage their end-to-end maintenance processes from a unified platform. Operators and owners can now access maintenance information including product updates, Airworthiness Directives (ADs) and Service Bulletins (SBs).

"Our focus at MD Helicopters is to provide exceptional customer experiences. One of the ways we do this is by helping ensure

about people

Weiser Now Director of Helicopter Services at JSSI

Jet Support Services (JSSI) has promoted helicopter industry veteran of 40 years, Raymond Weiser Jr., to senior director of helicopter services. He will be responsible for the direct client relationships post sale. He will play a key oversight role for major events, as well as transitioning and delegating responsibilities to the team that has been built around him.

Weiser

“Ray has played an instrumental role in our successful growth plan in the helicopter segment,” commented Kevin Thomas, senior vice president, Business Development and Strategic Planning for JSSI. “As we continue with our aggressive expansion into this market, Ray’s leadership will help us strengthen our relationships with operators.”

Weiser, an ex-U.S. Army helicopter crew chief, has gained industry experience with Turbomec, Rolls-Royce and Vector Aerospace. He also currently serves the Helicopter Association International as a member of the Technical Committee.

B&H Appoints Jimenez; Relocated Osman

B&H Worldwide has appointed Blas Jimenez as national operations manager in the United States. He will be based in Miami, FL but will also work out of the Los Angeles office. Jimenez has 25 years of logistics industry experience and joins B&H from OCASA Logistics where he was USA chief of operations.

Rami Osman, a 10 year B&H veteran has relocated from Los Angeles to London to become export manager. He will be responsible for managing the export teams and the global AOG centre. Osman has experience of working in the Los Angeles, Miami and Dubai, UAE, offices.

Barber to Represent Duncan Aviation in EMEA

Barber

Tim Barber has joined Duncan Aviation as its aircraft sales and acquisitions representative in Europe, the Middle East and Africa (EMEA).

Barber was previously behind the test establishment of JetBrokers Europe >>>

Sikorsky's Dana Fiatarone (left) with Dan Schultz (right) brief the media on the company's measures that are turning around customer support response times. (Photo: Andrew Drwiega)

our aircraft are serviced efficiently and effectively through improved access and more intelligent content and information management,” said Randall Schaffer, director, aftermarket business development & customer engagement at MD Helicopters.

“ATP is constantly looking for ways to leverage technology to make aircraft safer and improve efficiency for our customers,” said Ted Haugner, vice president, OEM Sales for ATP. “We’re pleased to partner with MD Helicopters to enable them to quickly enhance their service capabilities.”

ADS-B for Rotorcraft

With the FAA’s 2020 mandate for ADS-B Out compliance drawing ever closer, Vector Aerospace announced that it had received approval from the European and United States airworthiness authorities for its ADS-B solutions for Part 27 and Part 29 rotorcraft.

In December 2016, Vector received European Aviation Safety Agency (EASA) supplemental type certificate (STC) approval for its Part 29 rotorcraft ADS-B solution for the Airbus Helicopters AS332 L/L1 Super Puma, Leonardo Helicopters AW139 and Sikorsky S-76.

Simultaneously, Vector received Federal Aviation Administration (FAA) STC approval to extend the approved model list (AML) its Part 27 ADS-B solutions to include the Airbus Helicopters H120/EC120, H125/AS350 and H130/EC130 light helicopter families.

Vector’s Part 29 ADS-B retrofit upgrade has already received STC approval from the national airworthiness authorities of the USA (FAA), Brazil (ANAC) and Mexico (DGAC). This STC – which utilizes the L3 Lynx NGT-9000 transponder – allows for a panel mount or remote mount transceiver, if cockpit space is a challenge.

The company’s ADS-B In/Out solution for the Airbus light helicopter family offers customers a choice between using the L3 Lynx NGT-9000 transponder or Garmin’s GTX-345 unit.

In contrast Precision Heli-Support (PHS) has selected the FreeFlight Systems RANGR Series as its platform for developing an FAA ADS-B compliant system for the MD Helicopters 369, 500N, and 600N rotorcraft. Jerry Guevara, PHS’ general manager said, “Discussions on ADS-B have steadily increased over the past 10 years and for most, the reality has set in that 2020 is no longer far away.” He said the company’s aim was to provide a low cost transition to customers with minimal downtime.

Engine MRO: Room for Expansion

During Heli-Expo, AVM magazine was invited to tour the facilities of Safran Helicopter Engines USA and Safran Electronics & Defense Avionics at Grand Prairie, Texas. The facility provides engine assembly, engine MRO and customer support to North and South America.

Doug Dupont, USCG/USCBP key account manager stated that the facility had manufactured 134 Arrius and Arriel engines through two production lines in 2016, and was on target to achieve the same in 2017. The facility has capacity to ramp-up to a maximum of 500 engines per annum. It takes around 10 days to build an engine using five module lines.

Engine MRO is a core part of the business with each engine received now taking slightly less than 60 days to be returned to the customer, a marked improvement on years gone-by. This is the result of a company wide drive to reduce turn-around times. Last year the facility provided maintenance on 465 engines through its MRO shops and this year is expected to handle a minimum of 420.

Safran’s US business accounts for 25 percent of the company’s global revenues with Boeing being its largest customer. Safran supports three large US government helicopter fleets. The U.S. Army’s Airbus UH-72 Lakota is powered by two Arriel 1E2 tuboshaft

Just in time to say goodbye.

Keeping you in the air. The best time to develop services for tomorrow's technology is today. That's why we're doing that now — along with integrating new models, materials and technologies in our portfolio as quickly as possible. Our goal is to keep your aircraft off the ground, tomorrow as well as today. So let the future arrive: our services will be waiting. Talk to us.

» and oversaw its operational merger with JetBrokers. He left the business in mid-2015 and worked with Air Partner. He has experience and directorships held with businesses listed on the Financial Times Stock Exchange (FTSE) and the Alternative Investment Market (AIM). Said Steve Gade, vice president of marketing and business development with Duncan Aviation. "Tim is well-respected and well-connected in the industry, has a great grasp of the market, and very strong financial skills. Tim will work very hard for his customers and we are proud to have him represent Duncan Aviation in the EMEA area."

Kellstrom Welcomes Greer to Boost Sales Growth

Greer

Kellstrom Defense Aerospace has appointed William Greer as director of sales and contracts for the engineering and manufacturing. He will be responsible for growing global sales for engineered products, expanding proprietary product offerings, improving the overall customer experience, and managing contract performance.

Geer has management experience gained with Teleflex and LMI in Southern California, Dukes Aerospace, and most recently, as director of sales & marketing for RSA Engineered Products. He will be based in Southern California and will be part of the global business development team.

Stuart Reid, executive vice president, at Kellstrom said: "Bill has extensive experience driving growth and expanding profitability in the aerospace market. I look forward to a positive impact on our growing engineered products business."

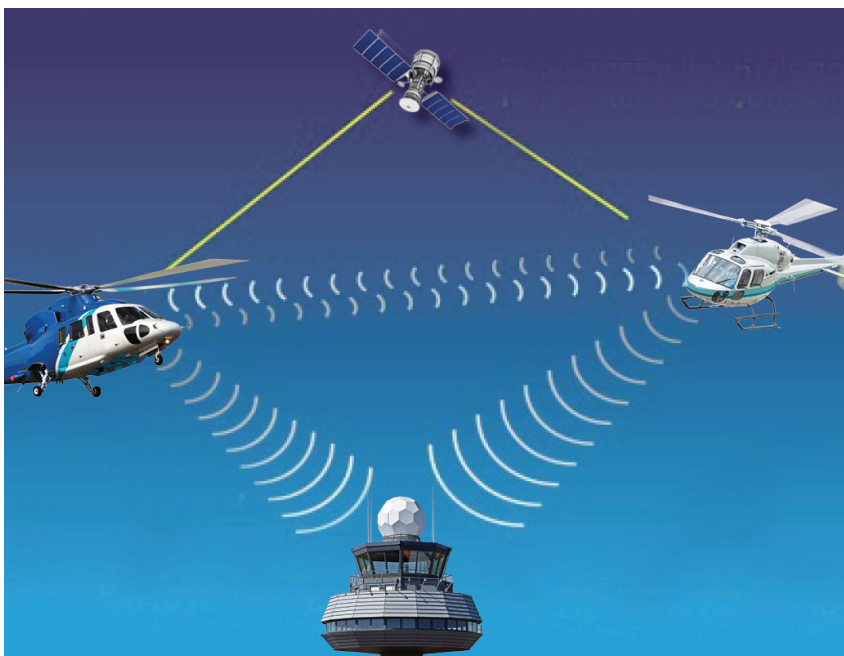

John Wing Rises Again at Pemco

Wing

Pemco World Air Services has promoted John Wing from program manager to senior MRO manager. He will be based in Tampa where he will oversee all maintenance operations.

Wing began his career with Pemco in 2008 as a lead A&P mechanic and has progressed as supervisor, weekend-and-night shift production manager and, most recently, as program manager of a major US airline.

Vector Aerospace now has European and United States airworthiness authority approval for its ADS-B solutions for Part 27 and Part 29 for rotorcraft. (Photo: Vector)

engines with a total of 800 engines to be maintained; the U.S. Coast Guard uses the MH-65 Dolphin with its twin Arriel 2C2-CG engines - adding another 200 to Safran's care list. The third Federal customer is the U.S. Customs and Border Protection agency with its 60+ AS350 A-Stars powered by Arriel 2B engines and 20+ Ec120s with Arrius 2F engines.

News Round-Up

Lord Corporation has released a free mobile app designed for MRO customers looking for parts. Available for iOS under Lord MRO Services, the interactive tool gives access to over 110 aerospace aftermarket parts for 15 of the 25 platforms that Lord directly services.

Lord has also extended its warranty and repair offerings for several programs. These include: Bell 412 main driveshaft boot overhaul; Bell 206 TT Straps PMA; Bell 412 main rotor spindle exchange program; Bell 430 shear restraint exchange program; Schweizer 300 main rotor damper and tail rotor bearing ; and Bell 206 trunnion bearing 3-year/2,500-hour warranty. Francois Magnan, Lord's aftermarket customer manager, said that the continual refinements in the repair and warrant programs were a result of paying closer attention to the needs of owners/operators. 'Supporting the Legacy' is a campaign from Heli-One designed to provide operators with S-61 maintenance support by offering over 200 proprietary repairs and extensive upgrade modifications.

Heli-One's nose-to-tail MRO service include all levels of inspections and checks, dynamics, airframes, hydraulics, and avionics. Heli-One claims "hundreds of innovative repairs to save parts typically deemed Beyond Economical Repair (BER) and has worked with operators to find solutions to safely extend the lifespan of the aircraft."

Standard Aero and Rolls Royce jointly celebrated their 50 year relationship over the maintenance of the M250 helicopter engine. According to a statement from Manny Atwal, vice president and general manager of StandardAero's helicopters business unit, over 50 years her company has been able to "make significant improvements to increase ITT margin, reduce gearbox vibration and improve compressor performance providing better fuel consumption and improving helicopter operators' mission envelope." In turn, Rolls Royce presented Standard Aero with three awards for 'Customer Satisfaction,' 'Program Investment' and 'Total Quality' during a reception at Heli-Expo. Rolls-Royce also released its FIRST (Fully Integrated Rolls-Royce Support Team) free smart phone app for helicopter operators using the M250 and RR300 engines. The app is available for both Apple and Google Android devices.

Scott Baier, Rolls-Royce, MRO manager, said: "The new FIRST network smart phone and tablet app makes it easy for operators to find 24-hour support including finding an authorized service center, purchasing parts and contacting the Rolls-Royce operations center."

The engine manufacturer also stated that has expanded support for RR300 engines used in Robinson R66 helicopters through its TotalCare maintenance program. It released an improved engine monitoring unit with enhanced reliability; increased the number of deployed technical representatives and added an online RR300 customer training program through Aviall, the exclusive RR300 parts distributor.

MAINTENANCE TRAINING AS ADVANCED AS YOUR AIRCRAFT

Advanced aircraft require equally advanced maintenance and training. FlightSafety works directly with manufacturers to develop a full range of factory-authorized, in-depth classroom and hands-on, technology-based training. Professional, safety-focused training that's approved by leading aviation authorities around the globe. More courses, more instructors, more locations. Curriculum includes the latest information from the manufacturers as well as training based on real-world operator experiences. Technicians learn best practices from accurate, carefully crafted, constantly updated courseware. From initial familiarization to advanced professional development – online, on location and at convenient Learning Centers worldwide.

Lufthansa Technik and MTU Aero Engines Partner Over GTF Engine Maintenance

Signing ceremony with Michael Schreyögg (left) and Dr. Johannes Bussmann

Lufthansa Technik and MTU Aero Engines have signed an agreement to establish a joint venture company for the maintenance, repair and overhaul of geared turbofan (GTF) engines. Signed on 20 February this year, it is expected to come into force in the second half of 2017. Each company will hold a 50 percent stake.

According to the plans, €150 million will be invested in the new facility which will be operational by 2020 and have a workforce of over 500 employees. It is being designed to accommodate over 300 shop visits of PW1000G-family GTF engines for the Airbus A320neo family and other aircraft. The search for a globally competitive location in or outside Europe will be completed within a few months' time.

Dr. Johannes Bussmann, chairman of the Executive Board of Lufthansa Technik AG, said: "We are pleased to have found a strong partner in MTU with whom we can steer our joint company to success. For Lufthansa Technik, this move marks another important step in strengthening and expanding its partnerships with reputable engine manufacturers."

Michael Schreyögg, chief program officer of MTU Aero Engines AG, commented: "With the new joint venture, MTU is continuing its successful partnership strategy. Lufthansa Technik is the ideal partner for us in this endeavor. By setting up a joint facility, capital investments can be shared and opportunities for synergy and scale generated for both companies."

In July 2016, Lufthansa Technik became a member of the aftersales service network for GTF engines. MTU Aero Engines is a partner of Pratt & Whitney in the PW1000G programs; the engines have been selected as the propulsion systems for new aircraft programs launched by five different aircraft manufacturers. To date, airlines around the world have ordered more than 8,000 of the engines.

Lufthansa Technik and MTU have been partnering in a successful, 50-50 joint venture in Malaysia since 2003. Airfoil Services (ASSB) near Kuala Lumpur specializes in the repair of low-pressure turbine and high-pressure compressor air-foils.

New Joint Venture in China Creates BLMI

Air France Industries KLM Engineering & Maintenance (AFI KLM E&M) and Beijing General Aviation (BGAC) have created a maintenance joint venture - AFI KLM E&M-BGAC Line Maintenance; although it will thankfully be known as Beijing Line Maintenance International (BLMI).

The new entity results from Chinese government policy which is encouraging foreign companies to partner with Chinese companies.

The joint venture is due to begin operations in April and it will provide line maintenance services for aircraft in the Air France KLM fleet at the Beijing airport, before extending its service to customer airlines operating in China.

At a ceremony held at BAIC (Mother Company of BGAC) headquarters in Beijing on February 27, BGAC chief executive Ling Zhuanghui said: "This agreement is an important milestone for our group, which aims to become a leading aircraft line maintenance player on the Chinese market. AFI KLM E&M is globally recognized for its MRO expertise and service quality and will be our best ally in achieving our objectives."

Anne Brachet, Executive Vice President AIR FRANCE KLM Engineering & Maintenance (E&M), said: "We are delighted with this opportunity to

strengthen our international line maintenance capabilities. In BGAC, AFI KLM E&M has found a Chinese partner with a strong local foothold and reputation, which is a guarantee of success for the future joint venture".

3D Printing: Hype, Hysteria or Good Plane Sense?

by Charlotte Adams

Additive manufacturing (AM), or 3D printing, grabs headlines, but how relevant is it to the aftermarket, asks Charlotte Adams?

A few years ago 3D-printed parts seemed on the cusp of acceptance in commercial aero engines. Load-bearing parts seemed to be the next frontier. But such aspirations have proven somewhat overoptimistic, given the lack of mature standards, rules and infrastructure in this area. A couple

of 3D-printed engine parts have been approved, but 3D printing at this point appears to be used mainly for making prototypes and plastic parts.

Still AM promises faster production of lighter-weight and stronger components that are as safe and effective as their traditionally manufactured counterparts and much less wasteful of the raw materials consumed. For an AOG (aircraft on ground) situation the appeal is dramatic, as these parts – once designed and incorporated into a computer file – could be produced at

The MV-22B Osprey has tested a 3D-printed critical component in the engine nacelle. The 3D printed titanium link helps hold the engine onto the wing (there are four links per engine; only one was 3D printed during the test). (Photo: U.S. Navy)

short notice, on demand, anywhere in the world. Thus while adoption is slow, it is proceeding on both new-production and aftermarket tracks.

Moreover, as the lines between repair and manufacturing continue to blur, the idea that a repair station could print parts on site is not absurd, said Jason Dickstein, president of the Modification and Replacement Parts Association (MARPA).

"Manufacturers are operating repair stations," he said. "They should be able to extend their production quality systems to permit production of parts in their own repair stations using additive manufacturing. As long as the production quality systems are developed to protect the practice, this could permit on-demand and on-site manufacturing as parts are needed, using additive manufacturing."

New and Replacement Parts

TEG, an engineering and production company in Mullingar, Ireland, recently 3D-printed a plastic speaker grill panel (the outer covering for a cabin audio unit) for a Jetstream 41 commuter aircraft. Phil Beard, TEG's technical director explained that the airplane is out of production and the original component manufacturer was no longer in business, so the replacement part was designed and produced using AM technology. TEG completed the job in about nine days and the part is now in use.

The speaker grill panel was a good fit for 3D printing, said John Hunt, TEG's managing director. Since it was a small run of only about 20 parts it would not have been cost-effective to create the tooling for a more traditional process such as injection molding.

TEG has EASA production organization approval (POA), so it can produce and issue parts with EASA Form 1/FAA 8130-3 tags for use on aircraft. The firm expects to receive EASA design organization approval (DOA) shortly. It employs both traditional machining and AM manufacturing techniques.

According to Beard, while AM technology has enormous potential, it is still finding its way, especially in metallics.

AM-produced metal parts can have rough surfaces that require traditional milling processes to make them flush. Furthermore 'spatter' from the production of the first part may cause flaws in subsequent parts using the same 3D printer bed, a factor that is not an issue with plastic parts.

TEG uses AM where the technique makes economic sense, said Hunt. "In many cases it may be more expensive and time-consuming to use 3D printing" versus traditional techniques, because of the upfront engineering effort required to understand the original part's material characteristics and to prove that the AD alternative is just as good an alternative or better.

Another user of 3D printing is ST Aero, which employs the technology in its VIP interiors business for prototyping and small production of non-structural parts.

The Belgian company, Materialise, also announced in November of 2015 that its certified factory is 3D-printing flight-ready plastic parts for the Airbus A350.

Military Leadership?

In the military it is frequently true that elderly platforms long outlive their original supply chains. So military programs are likely to drive the technology forward since the armed services have more latitude for innovation and more tolerance for risk, stated Wayne Plucker, Frost & Sullivan's director, North America, aerospace and defense.

But small unmanned air vehicles (UAVs) are a good starting point when looking at military requirements. The advantages of on-demand printing of custom UAVs for an infantry squad would be compelling. The U.S. Army has flight tested a 3D-printed On-Demand Small Unmanned Aircraft System as part of a recent Expeditionary Warrior Experiments exercise. Worryingly, it is also thought that ISIS is working on small 3D-printed weapons, which may start to make an appearance on the battlefield or elsewhere.

The U.S. Air Force has some 3D-printed parts flying, revealed Brigadier General Mark K. Johnson, commander of the Oklahoma

TEG's 3D-printed plastic speaker grill panel for a Jetstream 41 commuter aircraft which is certified with EASA Form 1. (Photo: TEG)

City Air Logistics Complex (ALC). "But ... these are non-structural plastic parts that don't affect airworthiness," he added. Indeed several news outlets reported the approval of 3D-printed plastic end caps for seat armrests on the USAF's E-3 command and control aircraft. But Johnson stressed that the current 3D printing focus is on parts for non-flying infrastructure and on prototypes for flying parts that are eventually manufactured by conventional means.

But the ALC has used additive repair techniques for decades. "For example, we have components that are repaired today by adding base material back to the part through plasma spray or welding techniques," Johnson said. "The parts are then machined or grinded to the finish tolerances."

Today's additive techniques result in material properties and tolerances that are not as good as traditional manufacturing and aren't suitable for manufacturing parts from scratch, he said. But the "beauty of additive repairs is that by salvaging a significant portion of the original base material, you can maintain most of the original properties and use the added material to relieve stress concentration points and restore dimensions." He cited the example of 'undrilling' holes in aircraft parts. "A common failure initiation point in our aircraft parts is where holes have been drilled. If we can detect these failures, 'undrill' the hole, and drill a new one, we could potentially salvage an otherwise good part."

The next military frontier may be the 3D printing of load-bearing airframe parts, Plucker predicts. Take, for example, a clip attaching a stringer to a rib in the aircraft structure. Could you do that with a 3D-printed part? "Probably, but approval by the civil authorities would be a significant event."

Once 3D-printed airframe repairs and replacement parts have been proved in military airplanes and have some history, however, the likelihood of being able to migrate such developments to the civilian realm is pretty good, he believes.

The U.S. Naval Air Systems Command took a step in that direction last year with a successful flight demonstration of a flight-critical airframe component on an MV-22B Osprey. The aircraft featured one 3D-printed titanium 'link and fitting assembly,' a component that is used to help secure the engine nacelle onto the wing. There are four such assemblies per engine nacelle, but only one of them was 3D-printed in this trial.

Regulatory Angst

The FAA is just beginning to get its arms around the subject of 3D printing and has expressed many concerns about quality control, repeatability, and lack of industry databases.

FAA officials have stated that ‘AM is a relatively new technology, with virtually no current field experience or full-scale production experience in commercial aviation applications’. They cite numerous risk factors, such as the large number of process parameters to be controlled, the potential for defects, the absence of accepted and validated non-destructive inspection (NDI) methods, and the lack of industry-accepted material and process specs and standards.

Some regulators also appear to be concerned about an influx of non-OEM players. Since it is possible to reverse engineer parts from 3D data files using technologies such as laser scanning, there could be “a flurry of PMA [parts manufacturer approval] activity,” according to Terry Khaled, the agency’s chief scientific and technical advisor for metallurgy in a 2015 presentation.

Dickstein is more optimistic: “Additive manufacturing is just another production tool, like casting or CNC [computer numerical control] lathing; and we need to treat it with the same production quality rigor as any other manufacturing process – and that means doing things like controlling design data, controlling suppliers, and having adequate inspection mechanisms to ensure conformity. We just need to figure out how to apply the regulations to control this particular production mechanism.”

The current preliminary FAA consensus is that the existing 14 CFR rules are applicable, but that the issuance of additional guidance materials is likely in order to address specific means of compliance. It does not foresee widespread use of AM among smaller companies until consensus specs and standards and best practices emerge. **AM**

Digital Data Simplifies Process Not Safety

by Andrew Drwiega

Airbus Helicopter is investing in digital analysis to take it to the next level of customer support

The Airbus Helicopter work ethic is currently epitomised by its new engineering facility. "Don't call it a building," said Rémi Maillard, VP chief engineer development helicopters rather proudly, as he guided a group of international journalists around the new engineering facility during a pre-Heli-Expo visit in late February. "This is a tool for us to use," he asserted, almost challenging us to disagree with him.

Leaving aside this mild eccentricity, he went on to explain the management's attitude to project problem solving involved bringing together a selected group of individual engineers from various backgrounds to 'work the problem' for as little as a week, or a maximum of around three months. This is not the core development team, but a group with the specific task of exploring one aspect of development. "It doesn't matter if they

Guillaume Feury, Airbus Helicopters' chief executive officer states that digital technology is being integrated into customer support and services.

initially fail," said Maillard, "because we always learn and push our understanding forward. If we need to we can then reform the team with other individuals who can push it forward again." Having seen one such group - all looking young and eager - it seemed to be a policy that would surface results quickly.

Airbus Helicopter is certainly moving forward. Guillaume Feury, the company's chief executive officer, told journalists earlier that day: "We have increased our civil market share. In spite of our difficulties, we continue to invest in products - you will see what we

do in the military and commercial UAVs [VSR700 unmanned naval rotorcraft] as well as City Airbus."

Feury emphasised that "digital is a priority for us - the way that we integrate digital technology into support and services. The HCare offer is more and more based on connectivity and digital tools. We are moving towards simplified, digital maintenance. The Helionix equipped fleet is allowing us to collect data while allows us to better understand the flight profile of the helicopters. It is the beginning of a new era for us.

It all adds up
Transforming aviation efficiency

1,300+ aircraft under contract

Supporting **1,000+** customers in 117 countries

HCare: a work in progress

Airbus Helicopter launched its HCare customer service package just over two years ago at the helicopter industry's annual gathering Heli-Expo, that year staged in Orlando, Florida. The concept was defined as a way to offer reliability and precise commitments to service that could be guaranteed to customers worldwide.

HCare is essentially defined by three offerings: Easy - focusing on the parts catalog and open to all customers; Smart, a by-the-hour support solution; and Infinite, providing an all inclusive maintenance service.

Leap forward two years and today Mathieu Louvot, executive vice president for Airbus Helicopter's Customer Support and Services, said that in a competitive market Airbus has looked to simplify the services on offer. Talking to Aviation Maintenance at Airbus Helicopter's French headquarters in Marignane, he emphasised on several occasions the slogan associated with this strategy: "HCare - important to you; essential to us." With the oil industry operating at a relatively low ebb, and the grounding of the H225 civil fleet following the tragic accident in Norway back in April 29, 2016, support and services has become a very important revenue line in Airbus Helicopter's balance sheet.

"With HCare Smart, we have removed exclusions and conditions. We have also scaled back the contract commitment from a minimum annual flight hour requirement of 150 hours to 100 hours. We removed the buy-in requirement for new owners of H125/H130 helicopters. We reduced prices on all the light single and twin-helicopters to be more aggressive in the market. The performance commitment meant that in 48 hours customers received a standard exchange of all the components covered by the power-by-the-hour (PBH)."

lighthousesafety.com

Mathieu Louvot, executive vice president for Airbus Helicopter's Customer Support and Services. (Photo: Airbus Helicopters)

The HCare Easy conditions were also improved: "We have broadened the scope of exchange to 80 percent of standard exchange stock. We also have HCare Easy Repair where a customer's repair will be completed in a maximum of 45 days whatever happens. If Airbus is late we offer a standard exchange of the part to the same standard which covers most hydraulic and avionic components although it might take a little longer for transmissions." While this has been rolled out in Europe and North America the next region to be addressed will be Asia later this year.

Louvot said that the HCare Infinite service, where Airbus takes care of everything from maintenance including the engine through to components, has been selected not only by the German military for the Army pilot training centre at Buckeburg in Germany where they operate H135s in a training role, but also with Australian Army aviation for the Tiger attack helicopter and MRH-90 fleets. The new British military rotorcraft training fleet with their H135 Juno have also taken the Infinite package. Louvot added. The U.S. Army's UH-72A Lakota helicopter fleet arrangement is mainly concerned with the guaranteed parts service, he said.

"Generally we are in a growth trend for services and support; it is a large part of the company and we need to keep it competitive while offering a strong service," said Louvot. Indeed support and services continue to be a growth market as the worldwide helicopter fleet increases. To stay competitive services such as HCare together with data analysis is beginning to reduce costs for operators. "This year we reduced the direct maintenance cost of the H135 by 15 percent, and the H125 by seven percent," declared Louvot. We have also been able to extend the time before overhaul of the main dynamic components and remove some safety life limits of components used by both types of helicopter.

"The MRO model is well developed and we need more customers to engage with the HCare products. We have actually substantially increased participation particularly among light-twin operators, moving from around 11 percent of the fleet to around 15-16 percent."

The Airbus Transition

In the first decade of the new millennium, Airbus Helicopter (then Eurocopter) was mainly concerned with launching new products.

HCare is essentially defined by three offerings: Easy, focusing on the parts catalog and open to all customers; Smart, a by-the-hour support solution; and Infinite, providing an all inclusive maintenance service. (Photo: Airbus Helicopters)

Hardly a year seemed to pass when ex-CEO Lutz Bertling was announcing the launch of a new helicopter. As Louvot pointed out: "There was a great deal of focus launching new models around 2010. We were in full design and development of the H175 and H-160 - they were to be the new models of the fleet."

But there was a sea-change too in an increased emphasis towards service and support. In 2013, the company headed in the direction of quality and safety, customer satisfaction and competitiveness and that has been the focus since. We now have a balanced approach between launching new projects and obtaining the full trust of our customers by delivering on the fundamental commitment of keeping them safe in flight.

Of course there have been several tragic accidents, with the civil H225 largely in the spotlight. To balance the reputation of that particular type, military users including the French Air Force have flown their EC725 Caracal's hard in several operational theatres, and the British Puma Mk2's are on long term deployment in Afghanistan.

Louvot spoke keenly about the introduction of Helionix and the impact that it will have through the introduction of data analytics

which will hugely improve the company's service and support capabilities. Helionix is a new avionics system includes a centralized maintenance function that monitors the status of all the helicopter's sub-systems.

"We introduced the online viewer ORION in 2014 and since then we have been working to continually improve the online experience. We went from a pdf viewer to a hypertext viewer which allows the customer to navigate through job cards much more easily," he said. ORION (Optimized Reader for Internet and Other Networks) is part of the Keycopter customer portal which was first rolled out for the H130.

"The next step is to get from a tech manual view to a real digital assistant," he stated. This will encompass the preparation of service checks, the collation of job cards, and the identification and ordering of parts in advance through a bespoke online system, not to mention giving engineers the ability to engage in e-troubleshooting. Louvot said that this wasn't the adoption of technology for its own sake, but a real step forward in making the maintenance process easier for the engineer.

One of the two prototype H160 helicopters about to embark on an altitude test. The H160 will come with the Helionix avionics system. (Photo: Andrew Drwiega)

Safety Culture

"The industry has still to make a lot of progress on safety," Louvot pointed out. He said that good safety culture had to be "driven by proper execution of maintenance added to the continual monitoring of the airworthiness of each and every platform. He admitted that today's manual job card centric working practises are complex and time consuming.

I recall the old joke about a helicopter comprising of thousands of parts flying in close formation, but this actually serves to emphasise the experience needed for engineers to be constantly vigilant and at the top of their game when it comes to maintenance procedures and safety.

Louvot makes the point of today's maintainers having to write down 16-part numbers time and again with the obvious opportunity to make mistakes. "While large operators have a system for this, many of the smaller operators of one, two or three aircraft do not," he said.

"Our digital strategy is to make life more simple for the customer, meaning that we take the data where they are. He said that the ambition is to provide maintainers with the ability to use tech manuals and maintenance procedures digitally, whether through laptop or iPad. "We want to take the data from the aircraft and link it to the tech manuals or operator's maintenance system - and do all the cross checkings through the computer rather than manually. That is what drives our digitisation of tech manuals with software such as Fleet Keeper."

With Fleet Keeper "you start the clock [data analytics] when you set off and stop it when you land. All the numbers are then computed and can be loaded into your maintenance system, or invoicing system. It provides full tracability of the life of the aircraft which is invaluable for lessors and owners, especially when they want to sell the aircraft." It can also trigger part orders and maintenance requirements which improves the availability of the aircraft.

Rolling out Helionix into the new HSeries of helicopters is the start of this digital evolution. "We want to use Helionix starting with H175, the H145, the H135 as well as the H160 when it enters production," said Louvot. "Helionix produces a lot of interesting data when it is downloaded from the aircraft and will allow us to do increasingly deeper analysis. We want to extend and enrich the HUMS services and take it to a wider range of customers outside the oil and gas industry. We want to help customers avoid aircraft-on-ground (AOG) and move them to a much more reactive and predictive maintenance environment where parts can be ordered before they are physically required."

3D printing

"3D printing is a good thing that would allow us to quickly produce 'erratic references' that are rarely required and often difficult to produce. These are parts that are frequently not stored in warehouses," said Louvot.

The challenge of 3D printing is to certify the fast manufacturing of 'these erratic references'. "We need to qualify the process in a generic way which would allow us to manage fast manufacturing. This concerns the type of part number that is ordered once every five years."

All these long term parts make up a substantial number of spare part orders, but they are infrequent. because we have so many references. "If 3D manufacturing can help with the production of these parts on demand and reduce the lead time it would be of huge benefit to us and to the customers," concluded Louvot.

When asked to summarise the road ahead for Airbus service and support, Louvot said that there was always a constant drive to improve customer satisfaction and service: "We will make our tech manuals easier to read and navigate. Digital products have a lot to contribute to the future." Indeed, throughout aviation it is a constant theme that data collection and analysis will drive improvements to maintenance both in time and money with a significant impact on AOG reduction due to unserviceability. **AM**

Aerospace Repair Services from Barden & FAG:

As-new quality at a fraction of the new price!

The Barden Corporation and FAG Aerospace - two of the acclaimed companies of the Schaeffler Group - offer world-class remanufacturing services that can significantly lower your total maintenance costs.

Without compromising system reliability.

As you would expect from one of the world's preeminent bearing manufacturers, we don't merely inspect and clean your bearings. We restore them to as-new condition, with all components manufactured to their original specifications by our OEM-approved production facilities. Plus, all of our reused and remanufactured components are 100% NDT-inspected!

Strategically located for your convenience:

Aviation Electronics Europe 2017

MUNICH, GERMANY | AE-EXPO.EU
25-26 APRIL 2017

The international avionics industry will gather in Germany next month for the two-day annual conference and exhibition, Aviation Electronics Europe, which will take place on 25th-26th April 2017 in Munich.

The event includes a main conference program, a series of technical workshops and certified training courses as well as the largest exhibition in aviation electronics in Europe.

Adrian Broadbent, event director and owner of Aviation Electronics Europe, said, "We are delighted that the conference programme will deliver a broad range of experts informing, educating and sharing valuable information and knowledge with industry peers. The Aviation Electronics Europe conference has been regularly delivering the best programme to address the latest challenges and issues facing the avionics industry."

Leading international experts are invited to participate in the conference to address key industry hot topics and challenges, including the Single European Sky and Next-Gen initiatives. The following are news updates from exhibitors who are attending Aviation Electronics Europe.

TechSAT and TTTech Partner Over Next Generation Test Benches

Last year TTTech and TechSAT jointly announced the integration of TTTech's TTEthernet network switches into TechSAT's ADS2 avionics test benches for OEMs and system integrators.

TechSAT and TTTech extend their complementary expertise to assure the

TechSAT and TTech - experience doubled.

system integration and testing process scalability. Core is TechSAT's powerful 2nd generation Avionics Development System (ADS2). Target applications are electric aircraft and IMA systems. In the scope of the latest ADS2 update, TTech will provide 24-port 1Gbit/s TTEthernet network switches.

TTech's TTESwitch A664 Lab offers the ability of supporting standard Ethernet (IEEE 802.3), Deterministic Ethernet services such as ARINC 664 part 7 (AFDX) and Time-Triggered Ethernet (SAE AS6802) on one physical infrastructure. The solution provides advanced reconfiguration capabilities suited for the design of reproducible and reliable system tests.

"TTech's standards and quality are the norm against which one must measure the competition", commented Elwin Muerth, head of sales at TechSAT. "We are very pleased to have TTech as our partner in TTP, AFDX and Deterministic Ethernet networking. Together it is possible to support all aspects of the customer's product lifecycle - starting from development over integration until verification and even ground testing."

"We are delighted to see adoption of our AFDX and TTEthernet 1Gbit/s network switches by a market leader in aerospace system integration and verification platforms," said Ingomar Wenzel, product manager at TTech.

FreeFlight and Becker Team Over ADS-B

FreeFlight Systems has partnered with Becker Avionics to offer a complete ADS-B solution for business and commercial class aircraft.

By combining the Becker Avionics BXT6513 mode S transponder with FreeFlight Systems 1203C SBAS/GNSS sensor, and RANGR-RX ADS-B receiver, these remote mounted solutions will provide turbo prop and turbo jet business aircraft with a cost effective way to equip with ADS-B In and Out for the upcoming January 2020 mandate.

"With less than three years remaining to meet the ADS-B rule, there is a lack of cost effective, high quality options for the business

aircraft market," said vice president of sales and marketing, Pete Ring. "We are pleased to team with FreeFlight Systems to offer a complete solution for these operators, including transponder, GNSS source and ADS-B In receiver certified as a package," said Thomas Terschluss, director of sales and marketing.

Helionix Uses VxWorks 653 in Airbus H175 and H145 Helicopters

Helionix: avionics with safety in mind.

Airbus Helicopters uses Wind River's VxWorks 653 platform for its new Integrated Modular Avionics (IMA) system, Helionix.

The Helionix avionics system certified on the H175 and H145 helicopters has been designed to improve helicopter management. Wind River's VxWorks 653 powers the multi-function display, flight management and control systems, as well as the auto pilot. It provides resource management and partitioning capabilities that allow multiple independent applications of different safety criticality levels to run on a single target platform.

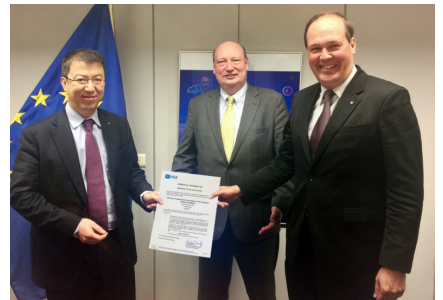

"As we sought to create the next generation of our helicopters' avionics, we turned to Wind River for its unmatched experience in this area," said Christian Franot, head of Helionix program at Airbus Helicopters. "Already validated in other IMA systems, Wind River safety critical technology offers the reliability, flexibility and configurability required for an implementation meeting stringent safety demands."

VxWorks 653 is now used in over 400 projects by over 200 customers in over 80 aircraft. In addition to the new helicopters above, VxWorks 653 is the leading ARINC 653 time and space application used by the Airbus Military A330 MRTT, Boeing 787 Dreamliner, Boeing 767 Tanker, Boeing P-8A Poseidon, Lockheed Martin C-130T, and Northrop Grumman UH-60V Blackhawk Helicopter.

EASA certifies the European AIS Database (EAD)

Eurocontrol became the first pan-European aeronautical information service provider to be certified under the Single European Sky legislation regarding the provision of the European AIS Database (EAD).

The European AIS Database (EAD) is the world's largest Aeronautical Information System (AIS) supporting the provision of the EAIM services. It was developed by the

From left: Patrick Ky, Executive Director of EASA, Henrik Hololei, Director General of DG MOVE, and Frank Brenner, Director General of Eurocontrol.

Eurocontrol Agency as a service to States and stakeholders. The aim of EAD is to ensure the availability of electronic aeronautical information of high quality, presented in a harmonised way and serving the requirements of all relevant users in terms of data quality and timeliness. The service allows other Aeronautical Information Service Providers (AISPs) to enter and maintain their data in a central repository and enables data users to retrieve and download AIS data in real time.

"We are pleased to have received the EASA certification for EAD which allows us to take this invaluable service to the next level," said Joe Sultana, director Network Manager. "We see EAD as an essential element of the work of the Network Manager as a whole and we look forward to seeing EAD as part of the revision of the Network Management Implementing Rule. This would allow the EAD to contribute even further to network efficiency and performance."

Future plans for Eurocontrol include the certification of the Network Manager as the first pan-European Service Provider of Central Air traffic Flow Management in 2019.

Rapita Systems Joins SECT-AIR project

SECT-AIR aims to develop systems that increase the productivity of developing critical software in the UK aerospace industry, and encourage the use of these systems. The project has been designed to meet the increasing need for efficient and maintainable development processes in the critical software industry.

This need will be met by the project partners, many UK institutions that are involved in critical systems development such as suppliers, tool vendors and universities. The project, which began in July 2016, will take place over three years with a budget in excess of £10 million, funded by the Aerospace Technology Institute and Innovate UK. During the project, Rapita Systems will develop improved processes for the development and maintenance of embedded software with an emphasis on unit test generation and execution. **AVM**

Old Adage is Hot New Trend

Preventive maintenance has always been a key element to keeping aircraft flying. Now more than ever.

ixing a problem before it becomes a problem has always been a major tenant in helicopter maintenance, with a large part of this 'preventive maintenance' practice based on estimating how many flight hours or cycles a part could safely be used, adding a 'fudge factor' for increased safety before it was overhauled or replaced.

While this system worked, it left a lot of good usage on parts being replaced, or overhauls being done before they were really needed. Today, the increasing sophistication of health monitoring systems, combined with the growing use of sensors on helicopters' dynamic components, is allowing OEMs and operators to extend the use of those parts.

“We are working with the FAA on a number of high value components that would return significant value to our customers.”

Health Usage and Monitoring Systems (HUMS) have been around for years. But like a fine wine, are improving with age, something that manufacturers are keenly taking advantage of to significantly expand the lives of their components.

The increasing capability of HUMS on the worldwide S-92 fleet is allowing Sikorsky to develop what it calls ‘usage-based lifing.’ This is a methodology that was approved by the Federal Aviation Authority (FAA), allowing Sikorsky “to leverage the millions of flight hours [from the S-92 fleet] to grant extensions on selected life-limited components,” according to Simon Gharibian, Sikorsky’s director, Fleet Management, Supportability & Training.

The key is over a million flight hours collected from a combination of discrete sensors on the aircraft, plus standard data flowing through the aircraft data buses. The system was designed with “a high enough design assurance level that we’ve got the FAA to allow us to use that data to grant a one-time life extension. We believe this was a first for the FAA,” Gharibian said.

The first component to receive a life extension was the main rotor hub. The life limitations were based on anticipated flight cycles. “We are able to go back into the HUMS history of a particular rotor hub, which is tricky in itself since some operators might move the hub from one aircraft to another. But we are essentially able to capture the entire life usage on a particular serial number hub, no matter what aircraft it was on. We could then show in certain cases that the number of ground-air-ground cycles were less than what we had assumed, which allows us to apply the approved methodology and grant a one-time service life extension.”

Gharibian noted that this was “just the tip of the iceberg in that it established the precedent that we have enough confidence in our HUMS information, we have enough confidence in the chain-of-custody of that information, that we can base important decisions like life extensions on it.

“That is where we are heading. We want to extend that capability to more complexly loaded parts. The hub was a relatively simple one-parameter load case. We are working with the FAA on a number of high value components that would return significant value to our customers. We have enough information from the S-92 from the HUMS system that would allow us to essentially understand what the part has gone through during its time on the aircraft and reconstruct what its actual life consumption is versus the design assumption.”

He added that there is also a continuous improvement aspect to the way Sikorsky has deployed HUMS. Whenever a degraded part is found during either a scheduled or unscheduled inspection, “the HUMS team can go back into the aircraft data to determine if there

Wiring Harness Manufacturing & Repair Services

**It's
What
We Do.**

Co-Operative Industries Aerospace & Defense is focused on providing cost-effective, quality electrical wiring harness services and support.

- Harness and interconnects for aerospace, ground support and testing applications
- FAA, EASA, and CAAC certified repair services
- AS9100 registered manufacturing facility that provides Capacity for long run, large volume production
- Build-to-print services with value added engineering support

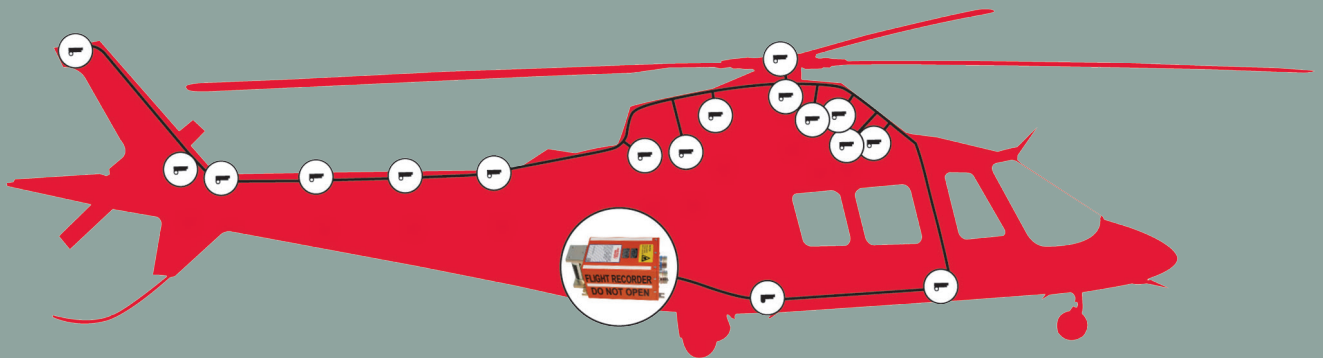

Contact us to learn how we can help with your wire harness needs. Interconnect solutions - It's What We Do.

Sensitive helicopter

Curtiss Wright, who supply complex electronic products to the defense and aerospace industries, state that helicopter fleet managers use Health & Usage Monitoring Systems (HUMS) to monitor critical rotational components within transmissions and drive-trains. The condition of each component is monitored in near real-time and fault indications are fed into a Condition Based Maintenance (CBM) system, an effective CBM system ensures that damaged components are replaced in the short window between detection and failure. The likelihood of a critical component failure during flight is reduced by 10-fold when a helicopter has a HUMS system on-board, assets the company. (Illustration from Curtiss-Wright)

H&L Instruments 900C Edge Profile Comparator

VISUALLY INSPECTS FAN & COMPRESSOR BLADE LEADING AND TRAILING EDGES

The 900C Edge Profile Comparator is a compact, self-contained optical instrument to compare airfoils with optimum profile overlays. The rugged hand-held module renders a magnified, bright, sharply defined image that is displayed on a high resolution, flat screen LED monitor.

The 900C also includes a video frame grabber to capture blade profiles for offline viewing. The instrument is used by mechanics during the blending process to greatly reduce rework time. It is not just an inspection instrument; its portability allows use at the bench and on the flight line.

were any indications that could have given early warning that the issue was occurring. If there was, the team can then build a special tool that searches for those same signatures in new data coming off the aircraft and deploy that to the fleet. So going forward, every time you run the HUMS ground station toolset on the data, it is now running that extra check, looking for the specific signatures that predict that issue."

However, putting a complete health monitoring system on a helicopter, plus a large range of sensors on multiple components, is expensive in both money and weight. So the task before manufacturers of smaller helicopters is to develop lightweight system that can provide the data needed at a lower cost.

Airbus Helicopters is working on a health monitoring system that will bring down both the cost and the weight, initially developing the system for its H145. "The idea is to have a very low level of investment so there is low cost to the customer, and be able to receive the data from the helicopter to earth. We will then collect the data and make recommendations to the customer to enable him to know which part should be inspected or replaced," said Fabrice Gonfalone, project manager.

This new system that will allow this HUMS technology in smaller, lighter aircraft is still in the early stages, with Airbus Helicopters working with vendors, he said. However, the system is expected to be certified on the H145 this October, to be followed by systems for the H125, H130 and H135.

The technology philosophy behind the system is based on what is currently being used in the automobile industry to allow dealers to know when maintenance is due on a specific car, he said.

One of the keys to the smaller system is the reduction in wire bundling. Bundling on larger helicopters can weigh as much as 50 lbs. to 100 lbs. Bundling on the smaller system should be around 7 lbs, depending on the aircraft, but no more than 20 lbs., Gonfalone said.

While the growth in health monitoring technology is growing rapidly, using the data provided by that technology is equally important.

The growing interest in health monitoring is becoming “a huge thing” in maintenance education, according to Keith Wilson, a program manager for Embry-Riddle WorldWide. “We have activities embedded in many of our aviation maintenance operations courses where we ask the students to consider the software applications and business solutions that are available for aircraft operators to help them do better trend analysis.”

He added that “we have our students explore emerging technologies that are out there, then debate them. We are able to glean a lot of data now. One of the emerging challenges will be developing a cadre of aircraft maintenance people who can connect the dots between all of that data, then take that data and determine the results of the data as they apply it to aircraft maintenance operations.

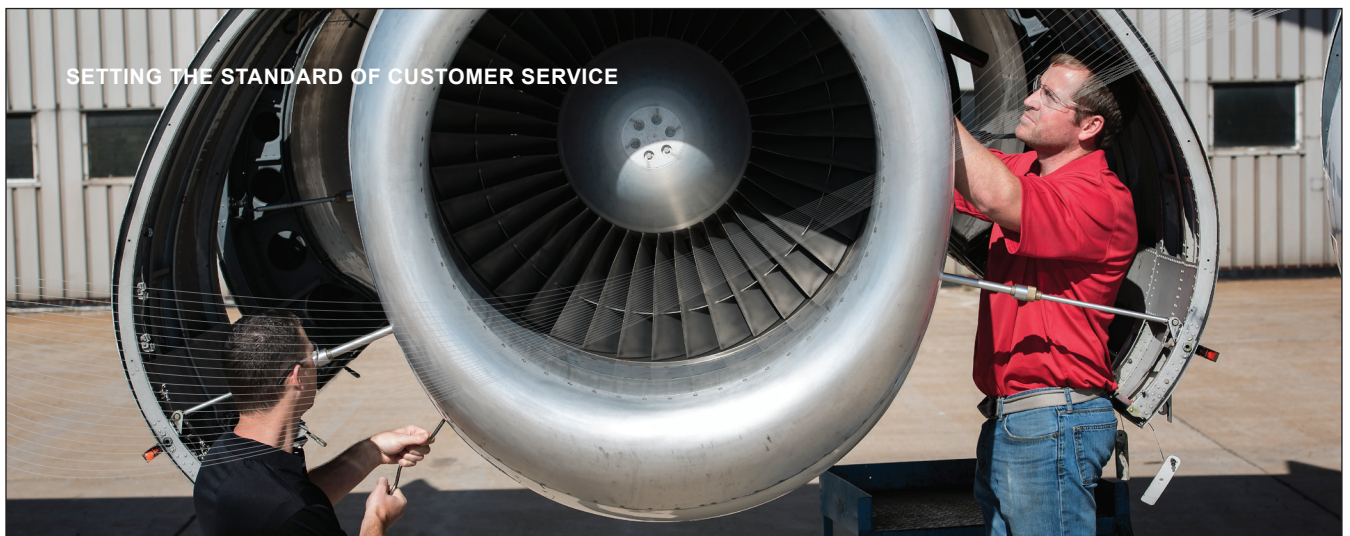

“You can collect data all day long. But if you are not able to apply that in a meaningful way to drive change or efficiencies, it’s not that helpful.”

Education aimed at using data derived from health monitoring systems is “an area we are going to see more resources thrown at. The data must be used as it relates to the aircraft operating system - and is what it is telling you exactly correct?”

Another current trend is the use of interactive maintenance manuals (IETMS) that can be linked with the HUMS data, Gharibian said. “This is a computer-based manual that can now embed things like 3-D graphics, animation and videos. So if I’m a maintainer and there’s a critical inspection or a critical assembly or disassembly process, I can actually embed a video so I can watch the procedure being conducted, seeing all the things I need to inspect.”

“You can collect data all day long. But if you are not able to apply that in a meaningful way to drive change or efficiencies, it’s not that helpful.”

Some of this has come from the military side, “particularly the U.S. Navy,” he said. “They have really pushed the envelope with interactive technical manuals, so we’re pulling over things like monolithic wiring diagrams. It used to be in the past you’d have a wiring diagram that was 10 pages, and you’re flipping from one page to the next, trying to figure out where all the wiring goes. With the interactive technical manual there is one big wiring diagram that you can move around, zoom in on and then literally, if you’re doing point to point continuity checks, you can change the color of the wires as you do the check. Change it so that if connectivity is good, it’s green. If connectivity is bad, it’s red. These types of tools accelerate the time needed to troubleshoot an issue.” **AM**

Corrosion Control Tips for Aircraft Technicians

by Dale Smith

Insiders' tips and tricks for spotting, treating and minimizing corrosion's damaging affects on aging aircraft.

A good guesstimate puts the average age of a commercial airplane in the U.S. over 15 years old. And many thousands of business and general aviation aircraft are over two to three times that age.

In itself that's not necessarily a bad thing. Unlike people, spruced up with a new interior, avionics suite

and a fresh coat of paint and it can be hard to tell a 40-year-old airplane from a brand new one. At least, until you take a close look beneath the shiny bits. Underneath it all lies something that is slowly, yet literally, eating the aircraft's structure away. And that culprit is corrosion.

While corrosion comes in many forms, the type that aircraft technicians are most interested in is both galvanic and concentrated cell (a.k.a. crevice corrosion). Galvanic corrosion occurs when two different metals (stainless steel and aluminum, for example) come

One expert on business aircraft cleaning quoted about 100 man-hours to thoroughly clean the exterior, interior and bright work on a mid-size business jet like a Falcon 2000. (Photo: Dassault)

in direct contact with each other and an electrolyte of some type. When this happens, the least 'noble' of the two will begin to erode. More times than not, it will be the aluminum that gets eaten away.

Crevice corrosion is common whenever moisture is trapped between two non-porous surfaces such as under cracking paint, a delaminated bond-line or an unsealed joint. Left unattended, this surface anomaly can quickly evolve into a much more aggressive form of pitting or exfoliation corrosion, depending on the alloy, form and temper of the metals being attacked.

Know thy enemy

Corrosion, or at least the type what we typically deal with is simply the electromechanical deterioration of a base metal caused by a chemical reaction to its surroundings – air and water.

Unfortunately, many of the metals that make up a typical airframe are prone to corrosion. And the situation can be made even worse wherever two dissimilar metals meet.

"Any time you have two dissimilar metals touching and you introduce moisture, the least noble of the two materials is going to corrode. That's just a given," stated Mark Pearson, general manager and owner, Lear Chemical Research Corporation. "And the more you operate in areas with high humidity, salt, heat and airborne pollutants, the faster that corrosion will accelerate." In fact, many experts believe that corrosion begins the moment the aircraft is assembled. Processed metals are in an unstable format. With the help of an electrolyte, they want to revert back to their original stable oxide form.

Of course, the airframe OEM's know this and have been using various barrier coatings like paint and zinc chromate to protect internal components for decades. While their steps do slow the process, zinc chromates and paints eventually become brittle and

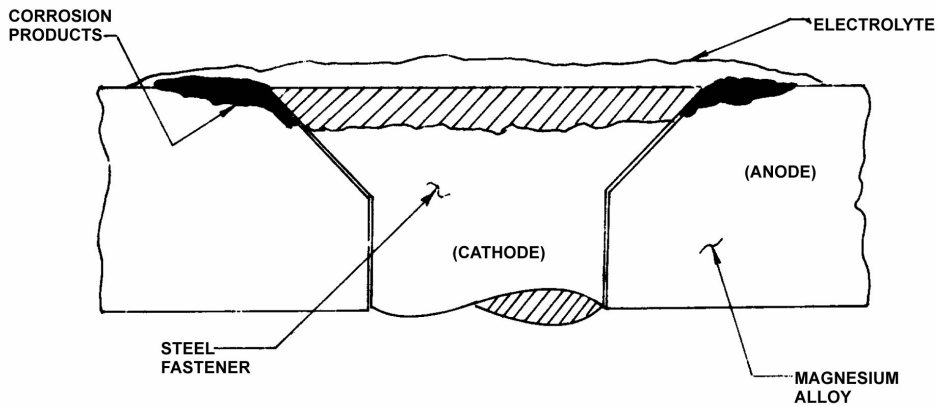

come away from the base metals. Once the barrier coating wears off, the corrosion switch is turned on. When corrosion appears in lap joints and around rivets and screws, technicians have to be ever more proactive in their ongoing inspections and the implementation of a program that will keep moisture out of the damaged areas.

As Pearson said, in its most basic form, airframe corrosion is the, electrolytic destruction of metal by an electrochemical reaction with its environment. If we could view a corrosion 'cell' at a microscopic level we see all the elements of a battery – you have an anode, a cathode, a path of current and an electrolyte such as water that's laced with a bit of salt, dirt, exhaust or other airborne contaminant. The introduction of the latter completes the 'circuit,' which causes the transfer of electrons to create corrosion between the two metals. (A more in-depth look at corrosion and what causes it at www.corrosion-doctors.org or by obtaining a copy of FAA Advisory Circular 43-4 Corrosion Control for Aircraft.)

Technicians: The first Line of Defense

"We've been developing and manufacturing corrosion control processes and products longer than anyone and experience has shown that mitigation or prevention is critical to corrosion control efforts," Pearson said. "Prevention is far better than trying to find a cure after corrosion has established itself in the aircraft. A preventative maintenance program is the least expensive, and most effective way you can have to minimize corrosion."

"To that end, technicians are extremely important in the ongoing battle to control airframe corrosion," he continued. "They need to be doing every inspection with the intent to find signs of corrosion – especially in older aircraft. Borescopes and other NDT tools are invaluable in helping technicians see under floorboards, behind

Galvanic corrosion occurs when two dissimilar metals make contact in the presence of an electrolyte. (See figure at left.) It is usually recognizable by the presence of a build-up of corrosion at the joint between the metals. (Diagram: Aviation Safety Bureau)

David Heissenbuttel, director of sales, Celeste Industries states that a dry wash system can be applied with a mop and removed to clean underneath an aircraft. (Photo: Celeste Industries)

pressure bulkheads and other tight spaces that are prone to holding a lot of moisture and contaminants."

Pearson cautioned though, that as critical the technician's role is in spotting corrosion's onset, they can't fall victim to complacency. "It can be an issue, especially if they work in an area of the world where there is a lot of salt and humidity. Surface corrosion pops up pretty fast and they get accustomed to seeing it," he said. "The technicians may become a little complacent and not look at finding light surface corrosion as a signal of a bigger problem growing in other parts of the airframe."

"As soon as they see signs of any corrosion, they need to begin a proactive dialog with the aircraft's owner/operator about the best course of prevention," Pearson said. "It's a lot easier and less expensive to treat it now than once it's established deep in the aircraft."

Longer Flying Through Chemistry

So you've completed an inspection on your customer's airplane and found signs of corrosion. What do you do now? Obviously, you're going to start by following the aircraft OEM's directions on how to clean and prepare the damaged area. But, you just have to ask yourself if that is the best course of action? After all, many of the thicker, resin-based, waxy, semi-hard coatings the OEMs use on new metal at the time of assembly may not be the best solution for corrosion prevention and control on an aging airframe.

By creating a barrier coating over existing corrosion, they may well keep out new moisture, but they are also doing a good job of

trapping existing moisture in, which will just lead to more corrosion growth. "We have an airline customer who was experiencing that exact situation," Pearson said. "They would perform a C-check inspection and find corrosion, which they would treat per the OEM's specifications. This was repeated again and again and each time the corrosion had returned in those areas."

"We met with them at a trade show and they agreed to test our ACF-50 on two of their DC-9s over two years," he said. "They followed the OEM's directions for cleaning the corroded areas, but instead of applying the 'approved' semi-hard barrier coating, they used our product, which acts as both a corrosion inhibiting compound (CIC) and a corrosion preventative compound (CPC)."

"Two years later, when those aircraft returned for their C-checks the technicians found no corrosion in those areas," Pearson said. "The difference was that our product actively flowed down into the corrosion cells and displaced the moisture."

"Our product is a dielectric 'anti-electrolyte,' which helps to prevent and arrest active corrosion," he said. "With no electrolytes present, the corrosion was effectively put into stasis. It effectively neutralized the electrolytes like orange juice, Coke, and coffee that were causing the corrosion within the structure."

Cleaning's Role in Corrosion Control

You can't eliminate corrosion, but you can slow its onset and progress: For the typical aircraft owner/operator and maintainer that all comes under the umbrella of a corrosion prevention and control (CPC) program.

“Proper aircraft cleaning is one of the most important things that can be done in corrosion prevention because it removes built-up from airborne contaminants, pollutants, salts from runway de-icing and other chemicals that come in contact with the aircraft,” explained David Heissenbuttel, director of sales for Celeste Industries. “In addition, microbial growth can remove paint and attract moisture to promote corrosion.”

While cleaning an aircraft’s interior and exterior is a critical part of normal maintenance, Heissenbuttel stressed the need to use the correct types of cleaners. Some household or automotive-style cleaners may actually do more harm than good.

“Products need to be tested to AMS specifications. Simply, if it’s not approved don’t use it,” he said. “Choose a water-based product that has low or no VOC’s and is biodegradable. Low odor cleaners are recommended, especially when working in closed-in hangars or aircraft interiors.

Also, products that are low foam and have a wide dilution range offer a number of advantages to the user because they can be used for multiple purposes.”

When it comes to the specifics of cleaning an aircraft’s interior and exterior, Heissenbuttel said that with regards to the interior, the biggest challenge for technicians comes with all the various

materials and surfaces they will have to deal with. “You need the right cleaners to strategically disinfect public areas like seats, galleys, and lavatories. Carpeted areas are especially critical,” he added.

“Again, you need to make sure that the disinfectant is approved for use in an aircraft. Some types recommended by the EPA are not.”

Another thing to consider, especially when cleaning a private or VIP aircraft, are all the different exotic materials and fabrics. Many natural materials like leathers and other animal skins come with special coatings. Check with the interior shop that did the installation to find out what kinds of cleaners are safe to use on these surfaces.

In addition, if you work for a corporate flight department or charter operation, it’s a good idea to have approved cleaners for seats, side rails and carpeting in the aircraft at all times. And it’s worth the investment to take time to train the cabin attendants on the right ways to clean a spill.

As for cleaning the aircraft’s exterior, while common sense and the right products are the best guidelines, Heissenbuttel said that

at many airports the days of wet washing are long gone. “Many airport regulations limit the amount of water run-off so you have to have a way to recapture the water before it gets into the soil,” he cautioned. “The trend today is to go with dry washing.

These are approved chemicals that require no water. They capture dirt and contaminants in the materials as you clean the aircraft. Just make sure you dispose of the used materials properly.”

Another benefit of dry washing is that technicians won’t be tempted to use a pressure washer on any part of the airplane. That’s bad on a number of levels, but mostly because it will force moisture inside of seams and joints. Places where once it gets in it never comes out.

Aircraft cleaning 101

While the types of cleaners that can be used is critical, the frequency of cleaning along with the associated care and attention you give the aircraft is extremely important to ensure that corrosion is ‘nipped in the proverbial bud.’

Unfortunately, like anything aircraft related it will take more time than expected to properly clean an airplane. One expert on business aircraft cleaning quoted about 100 man-hours to thoroughly clean the exterior, interior and bright work on a mid-size business jet like a Falcon 2000. No wonder cleaning is falling farther and farther down many a shop’s priority list.

Along with the obvious, another benefit to a good exterior cleaning is it gives technicians an opportunity to really get a look at the overall condition of the aircraft. Paint chipping away from corners of the main or luggage doors and access panels is just an open invitation to corrosion.

While the exterior gets the biggest part of the cleaning program, technicians must pay particular attention to the interior areas and not just the galley and lavatory. Crumbs, fruit juices, soft drinks, wine, dirt and other materials you really don’t want to think about, are left behind on various surfaces, in carpets and upholstery.

And all that needs to be removed properly to ensure it doesn’t contribute to the problem of airframe corrosion behind panels and under the floor and bulkheads. Also, when cleaning the interior – lavatory and galley – be especially conscious of any unusual odors. Off smells are often very good indicators that something’s amiss. **AMM**

David Westlund, Research Engineer, Structures and Materials Section, Federal Aviation Administration

David Westlund holds a BS in composite materials engineering from Winona State University and a master's degree in aerospace engineering from North Carolina State University. He joined the FAA in 2009 and is currently the program manager for the FAA's Maintenance and Inspection Research Program.

Composite Materials Handbook-17: Making Composites Safer through Standardization and Guidance

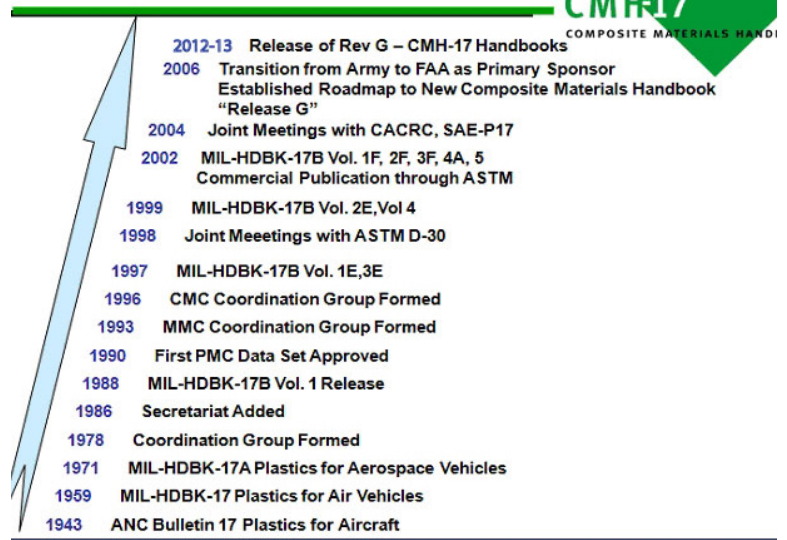

The Composite Materials Handbook, CMH-17 (formerly MIL-Handbook-17), provides information and guidance necessary to design and fabricate structural components from composite materials. Its primary purposes are the standardization of engineering data development methodologies related to testing, data reduction, and data reporting of property data for current and emerging composite materials; guidance on material and process specifications and procedures for utilization of the material data presented in the handbook; and methodologies for the design, analysis, certification, manufacture, and field support of composite structures. In support of these objectives, the handbook includes composite materials properties that meet specific data requirements. The handbook therefore constitutes an overview of the field of composites technology and engineering, an area that is advancing and changing rapidly. As a result, the document is continually revised as sections are added or modified to reflect advances in the state-of-the-art.

The handbook is sponsored by the Federal Aviation Administration (FAA) and run through collaboration between SAE International and the National Institute for Aviation Research (NIAR) at Wichita State University. The handbook is created and maintained through the volunteer work of material suppliers, OEMs, academia, and government. Meetings are held periodically in order to generate material for subsequent revisions of the handbook. Working groups have been built around the subject areas found in the handbook including: data review, guidelines, materials and processes, sandwich, spacecraft, spec data, statistics, testing, safety management, crashworthiness, and, perhaps most relevant to this audience, supportability.

The objective of the supportability working group is to provide useful guidelines in the design for and design of repairs for composite structures. This group is the primary responsible entity for a chapter of the handbook titled Supportability, Maintenance, and Repair. Topics in this chapter include inspection, damage assessment, repair design and substantiation, repair of composite structure, composite repair of metallic structure, maintenance documentation, design for supportability, and logistics.

The group consists of a broad representation of experts who attend meetings to discuss and create content for the handbook. Those involved in the handbook meet approximately every eight months and revisions to the handbook are put out every few years. During the meetings, tutorials are offered on composite certification and statistics. The next meeting is March 20th-24th and will be hosted by the University of Utah in Salt Lake City. We are always looking for new volunteers to contribute their expertise to the handbook. 

History

Avoiding the Expenses Associated with Hidden Hazmats in Aircraft Parts

Is that aircraft part that you are shipping to your customer a hidden hazmat? And are you complying with federal laws that affect the shipment of those parts? Many repair stations and air carriers ship aircraft parts that are hazardous materials, and they may not even recognize them as hazardous materials! It is important to be able to recognize hazardous materials and to package, identify and ship them correctly.

Some of the aircraft parts that can be hazardous material include:

- ✚ Fuel system components with residual fuel
- ✚ Life-saving equipment, like slides, rafts and life preservers
- ✚ Batteries, including avionics and other equipment containing batteries
- ✚ Compressed gas bottles filled with gasses like oxygen, nitrogen and carbon dioxide
- ✚ Passenger service units and smoke hoods (chemical oxygen generators)
- ✚ Actuating squibs
- ✚ Certain coatings and greases

These are just a few of the items of which you need to be aware.

Read Exceptions Carefully

There are many exceptions to the rules, but you need to be careful in how you apply those exceptions. Exceptions can be narrow, and they can be limited only to certain circumstances.

We've seen a number of situations where companies have failed to carefully read the details of an exception and this has led them to apply the exception in the wrong circumstances or to misinterpret the conditions that apply to the exception. Maintenance professionals have misread the scope of the life preserver exception, for example, and tried to apply it to all self-inflating

When reading an exception, the first step is to ascertain the conditions when it applies. Does

it only apply to shipping via certain modes of transportation? Does it only apply to certain configurations? If the exception only applies to shipments by ground, and your shipment is destined to be transported by air, then you may not be able to use that exception.

You also need to identify what needs to be done to claim the exception. For example, certain battery exceptions only apply when the battery is secured to prevent short circuits. I have been involved in hazmat enforcement cases that argued about whether the battery was adequately protected from short circuits. Don't leave this open to interpretation – use manufacturer-recommended caps.

Training is Required by Law

When you identify a hazardous material, you need to make sure that it is shipped by a person with the proper training. Training is required under Department of Transportation regulations in the United States. It is frequently a legal requirement in other countries, too, because the standards for training have been adopted by the United Nations.

The regulations change every year (some regulations – like those that apply to lithium batteries – can change substantially on a year-to-year basis. So recurrent training is not just a legal requirement; it is also a good business practice.

Looking for an affordable hazmat class that is focused on aviation industry articles? Check out dangerousgoodstraining.net for online training that you can accomplish from the comfort of your own desk, while still having access to a live instructor who can answer your questions. The next online class is scheduled for April 5-6, 2017. [AVM](#)

Puerto Rico

Lufthansa Technik

• **Lufthansa Technik Puerto Rico**, See ad p. 9, San Antonio Rd., Aguadilla, PR 604, 787-230-7700, info@lht-puertorico.com, www.lufthansa-technik.com

Founded in February 2014, Lufthansa Technik Puerto Rico (LTPR) is a fully owned company of Lufthansa Technik AG. The Puerto Rican company specializes in the maintenance, repair and overhaul (MRO) of narrow body aircraft of the Airbus A320 family. Lufthansa Technik Puerto Rico is thus the next base in the Lufthansa Technik Group to specialize in the overhaul of short- and medium-haul aircraft, consisting already of Lufthansa Technik's maintenance center in Berlin, Shannon Aerospace in Ireland, Lufthansa Technik Malta, Lufthansa Technik Sofia and Lufthansa Technik Budapest.

AIM GmbH is an established supplier of Test equipment for ARINC429, AFDX/ARINC664P7, and MIL-STD-1553. AIM's ARINC429 SmartCable™ for USB 2.0 offers a cost effective, highly portable test solution for maintenance, diagnostics, upgrade & repair of avionics equipment in the depot or in service. The EasyLOAD-429 Dataloader software option enables the loading of airborne computer systems using the ARINC615-3/4 protocol over ARINC429. AIM has offices in Germany, UK, USA with a world-wide network of qualified distributors.

The background of the cover is a close-up, low-angle shot of a jet engine's compressor section. The blades are arranged in a radial pattern, creating a strong sense of depth and perspective. The lighting is dramatic, with the upper portion of the engine in shadow and the lower portion, where the blades are more prominent, highlighted with a warm, reddish-orange glow. The overall aesthetic is industrial and high-tech.

• **AIM GmbH**, Sasbacher Strasse 2, Freiburg 79111, Germany, 49-76145229-0, Fax: 49-76145229-3, www.aim-online.com
AIM GmbH is an established supplier of Test equipment for ARINC429, AFDX/ARINC664P7, and MIL-STD-1553. AIM's ARINC429 SmartCable™ for USB 2.0 offers a cost effective, highly portable test solution for maintenance, diagnostics, upgrade & repair of avionics equipment in the depot or in service. The EasyLOAD-429 Dataloader software option enables the loading of airborne computer systems using the ARINC615-3/4 protocol over ARINC429. AIM has offices in Germany, UK, USA with a world-wide network of qualified distributors.

H&L Instruments developed the Model 900, a portable video edge profile comparator in 1985 for United Airlines for inspecting the leading and trailing edges of aircraft turbine engine blades. The current model 900C/CE is rugged precision instrument equipped for either 20x or 40x magnification and video to USB frame grabber to transfer images to a PC. The 900C/CE is compatible with inspection of GE, Pratt & Whitney, Rolls Royce, MTU, SNECMA and other turbine engine blades.

component control

• **COMPONENT CONTROL MRO & Logistics Software Solutions**, 1731 Kettner Blvd., San Diego, CA 92101, 619-696-5400, Fax: 619-702-3522, www.componentcontrol.com
Component Control is a leading developer and provider of MRO and Logistics Software solutions for the aviation industry. Its core product, Quantum Control, provides advanced aviation management support to OEM's, aftermarket service divisions, component repair and overhaul companies, MRO facilities, and part distribution/redistribution companies. Stockmarket.aero, also from Component Control, is an online aviation parts trading marketplace giving users access to a comprehensive search engine that includes parts in stock, MRO capabilities and part alternatives.

Over the last 30+ years, ILS has built the most active aviation and defense parts marketplace, ILSmart. This marketplace offers an efficient way to buy/sell/manage/evaluate inventory. The ILS MRO database provides average TAT and cost to overhaul, repair, bench check and exchange items. Other services include auctions, company profiles, message broadcasts, and defense logistics research data. Analytical reports provide supply/demand statistics, and pricing information. Standard and custom reports are available upon request.

OUR EXPERIENCE DRIVES YOUR EXCELLENCE.

When what matters is finely tuned, everything works. Iberia's merger with British Airways has made us stronger. Our technicians have more than 85 years of experience and are experts in their field. With our extended product range and joint resources we can offer you the high quality service that you demand.

STRONGER TOGETHER.

Iberia Maintenance. Commercial Direction.

The plane truth

Every second a plane takes off somewhere in the world enabled by our flight-critical products. From smart engine controls to fly-by-wire flight controls, a cabin system that elevates the passenger experience, and award-winning service and support, we continue to innovate for those who move the world.
